No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                              Score

It can be used as a universal carrier for the prepn. of an immunogenic conjugate. It is covalently bound to a peptide or polysaccharide hapten derived from a pathogen. This conjugate can be used as a vaccine for malaria. This peptide is recognised by different T-helper cell clones in association with alleles of the human MHC. It contains 2 epitopes: (a) 953-967, recognised by DR5-restricted clones; and (b) 947-960, recognised by all other DR and DP-
                                A helper T-cell epitope (AAW06130) comprises amino acids 947-967 of tetanus toxoid protein. It can be utilised in novel peptide vaccines (see also AAW06129, AAW06132) also including B-cell epitope(s) from human or rabbit cholesteryl ester transfer protein (CETP) to elicit an immune response against endogenous CETP activity, thereby treating or preventing a cardiovascular

                                                                                                                                 This T-cell antigen TT3 peptide may be attached to a core peptide contained in one of the 2 subunits of an alpha-helical coiled-coil heterodimer. Each core peptide is comprised of terminal and internal AA repeat sequences. This peptide antigen is attached to the core peptide through covalent linkages to certain AA of the internal repeats. The 2 subunits of the heterodimer are arranged in a stable alpha-helical coiled-coil configuration having a 1:1 stoichlometry, and the peptide antigen is disposed toward the outer surfaces of the configuration. The heterodimer may be used as a
                                                                                                                                                                                                                                                                          Hetero:dimeric polypeptide immunogen in c with different antigens on each sub:unit for antibody prodn.
                                                                                                                                                                                                                                                                                                                                               Zhou

It can be used in DNA plasmid-based vaccines against cholesteryl ester transfer proteins (CETPe). CETPs mediate the transfer of cholesteryl esters from high density lipoprotein (HDL) to very low density lipoprotein (VLDL) and low density lipoprotein (HDL) and vice versa. An increased CETP activity produces an atherogenic lipoprotein profile and induces atherosclerosis. A DNA plasmid-based vaccine comprises sequences encoding at least one B cell epitope of CETP linked in frame with at least one segment encoding a broad range helper T cell epitope. The vaccines can be used to elevate the ratio of circulating HDL to circulating LDL, VLDL or total cholesterol in a human. The vaccine can be used to produce anti-CETP activity in a human. The vaccine can be used to produce anti-CETP antibodies in vivo and for treating cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA plasmid-based vaccine encodes CETP B cell and helper T cell epitope(s) - used for elevating high density lipoprotein levels, for treating cardiovascular disease

These can be used to support an immune response against viral infections caused by hepatitis virus, HIV or cytomegalo virus. They can be used to enhance immune responses, especially B- and T-cell responses, of humans and animals against bacterial infections. The carbohydrate peptide conjugate stimulates the antibody and T-cell response without stimulating undesired immune responses. The composition is capable of increasing the survival of tumour bearing humans and animals. The present sequence corresponds to residues 947-967 of tetanus toxin. The synthetic peptide corresponding to this sequence may be used as an epitope in a carbohydrate peptide conjugate.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a new carbohydrate peptide conjugate, which comprises a carrier with a dendrimeric poly-lysine enabling multiple epitopes to be covalently attached to it. Also claimed are: (1) an antibody purified from biological fluid or cells of organisms administered with the carbohydrate peptide conjugate, and (2) a diagnosis kit comprising antigen-specific antibodies elicited by immunisation with the carbohydrate peptide conjugate, antibody and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused via a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a T-cell epitope peptide used to generate the chimeric peptide.
 This sequence represents a tetanus toxoid epitope and is recognised by the multispecific single chain antibody designated H22. The antibody can be used in the method of the invention for inducing antibody-dependent cellular cytotoxicity (ADCC) against a tumour cell which is characterised by overexpression of HER 2/neu or epidermal groups of the characterised by overexpression of HER 2/neu or epidermal groups.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In additional possible that they may be used in the treatment of cancer and it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprising: (a) an anti-Fc receptor antibody or an antigen binding fragment; (b) a portion which binds to HER Z/neu; and (c) a portion which binds to BGFR. The method can be used for treating cancers especially breast cancer or ovarian cancer. The multispecific antibody can also be administered prophylactically to vaccinate a subject against infection

                                                                                                                                                                                                                                                                                                    The present sequence is a tetanus toxin T cell epitope known as Helper Peptide P30. Hybrids of this peptide and an immunogenic peptide derived from tumour rejection antigen precursor MAGE-10 were used to generate polyclonal antiserum against MAGE-10. MAGE-10 binding monoclonal antibodies can be used to detect MAGE-10 expression. A correlation between MAGE-10 expression and cancer has been discovered and thus by determining the presence of MAGE-10, the presence of cancer can be determined. MAGE-10 expression can be detected using an immunoassay, an oligonucleotide hybridisation assay or via other standard techniques. This method is especially useful for determining the presence of bladder, ossophageal, head and neck, prostate or lung cancer, or malancer.

The method comprises effecting CC simultaneous presentation by antigen producing cells (APCs) of the CC animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) CC group derived from the PA and/or at least 1 First T helper cell group which is CC foreign to the animal. Analogues of human PSM, human Her2 and human/murine FGF8b comprising a substantial part of all known and CC predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope (e.g. P2 and/or P30) are also claimed. CC The method is used to treat prostate, prostate/breast or breast cancer covered to the PA is human PSM, FGF8b and Her2, respectively.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents the tetanus toxoid P30 epitope. It is cused to create a fusion protein with murine osteoprotegerin ligand (OPGL). Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose consensation of the tumour necrosis can be protein. The OPGL protein is synthesised as a type II complete the protein. The murine and human OPGL polypeptides are 87% to homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of CG differentiation in the absence of CSF-1. OPGL is also an activator of CG down-regulation of OPGL activity in an animal. The method comprises compined to induce an immune response in the animal. The method cone CG OPGL nanlogue to induce an immune response in the animal. The method cone conditions characterised by excessive constepprosis or other diseases or conditions characterised by excessive

The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) constructing oligonucleotide molecules that encode peptide epitopes; (b) annealing the oligonucleotides to form duplexes; (c) introducing the duplexes into an expression vector; (d) introducing the expression vector into a host cell; and (e) isolating the fusion protein produced from a culture of the host cells. The carrier protein can be used as a protective immunogen in the control of diseases caused by encapsulated bacteria. Sequences AAY49256-266 represent CD4+ T cell epitopes inserted in the recombinant polyepitope carrier proteins.
In vivo down-regulation of amyloid protein for the treatment of Alzheimer's, comprises presenting an amyloidogenic polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for in vivo down-regulation of amyloid CC protein such as beta amyloid (Abeta) in an animal, including human. The method comprising presenting to the animal's immune system an cCC immunogenically effective amount of at least one amyloidogenic protein CC or its subsequence and/or at least one analogue of the amyloidogenic CC polypeptide. The amyloidogenic protein or its subsequence, and its canalogue is useful for the preparation of an immunogenic composition cc analogue is useful for the preparation of an immunogenic composition cc analogue is useful in the treatment, prophylaxis or amelioration of Alzheimer's CC also useful in the treatment, prophylaxis or amelioration of Alzheimer's CC disease or other diseases characterised by amyloid deposits. They are also useful in the treatment of systemic amyloidosis, maturity onset CC disease or other diseases thuntington's disease, fronto-temporal CC dementia, amyotrophic lateral sclerosis (ALS), pick's disease and CC useful for inducing production of antibodies against an amyloidogenic consplication in the present sequence is Clostridium tetani P30 epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The invention relates to recombinant multivalent proteins (I) that stimulate an immune response to Plasmodium vivax. (I) comprises an determinants, fragments or conservative substitutions, derived from

derived from

antigenic

The invention relates to a new method for inducing killing of a tumor cell which expresses HER 2/neu or epidermal growth factor receptor (EGFR). The method comprises contacting the tumor cell with a multispecific protein comprising a component, preferably an antibody, which binds to an Fc receptor (FcR), Her 2/neu or EGFR. The method is useful for inducing killing of a tumor cell from breast cancer, sarcon

Sarcoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC than one stage in a life cycle of a Plasmodium vivax parasite. (1) is CC useful as a vaccine for stimulating an immune response, specifically a CC protective immune response that confers increased resistance to infection CC by Plasmodium parasites, such as P. vivax. (1) is especially useful in CC the treatment, prevention and reduction of malarial infection, as CC research or diagnostic reagents for the detection of Plasmodium species CC in a biological sample, and for conferring immunity against multiple CC the detection or measurement of antigenic epitopes derived from one or CC compares the comparising the recombinant proteins, is cost-effective, health-CC promoting intervention for controlling, preventing or treating the present sequence represents the amino acid compares of a P30 epitope, a component of the multivalent and vivac2p.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                  Score

CC through a linker to a solid phase, forming a complex of (A)-solid phase.

CC where (A) comprises 10-50 amino acids capable of forming a secondary complex of (A)-solid phase.

CC where (A) comprises 10-50 amino acids capable of forming a secondary complex of forming a secondary complex complex comprises an immunogenic substance and/or an immune mediator coupled on (A). The present sequence complex can be used as a scaffold for the production of chase complex can be used as a scaffold for the production of chasolid phase complex can be used as a scaffold for the production of chasolid phase complex can be used as a scaffold for production of complex can be used for the production of complex which is used for the chemical coupling of antigenic substances in an aqueous solution by conjugation. (A) derivatised with one or more peptides having fibronection, laminin- or vitronectin-like complastic surfaces, in particular to inhibit tumour growth and metastasis and for promotion of wound healing. Also a derivatised (A) can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

Peptides are recognised by numerous T-helper cell clones within the context of a wide range of alleles of the human MHC. The peptides may be used in an antimalarial vaccine inducing Ab. response to P.falciparium.

                                                                                                tetanus toxoid, designated TT830, was fused to the 3'-end of DNA encoding heavy chain sequences from the humanised anti-Fc gamma RI monoclonal antibody H22. The resulting fusion protein was shown to be significantly more efficient in antigen presentation and T cell stimulation that the TT830 epitope alone. A similar fusion construct was prepared coding for a mutant, antagonistic form of the epitope (designated TT833S) fused to the anti-Fc gamma RI. The

                                                                                                                                                    S
                                                                                                                                                                                                                                                     The invention relates to a new carbohydrate peptide conjugate, which comprises a carrier with a dendrineric poly-lysine enabling multiple epitopes to be covalently attached to it. Also claimed are: (1) an CC antibody purified from biological fluid or cells of organisms CC administered with the carbohydrate peptide conjugate, and (2) a diagnosis kit comprising antigen-specific antibodies elicited by immunisation with CC the carbohydrate peptide conjugate. Antibody and CC vaccines against tumours. These can be used to support an immune response CC against viral infections caused by hepatitic virus, HIV or cytomegalo CC virus. They can be used to enhance immune responses, especially B- and T-CC responses, of humans and animals against bacterial infections. The CC carbohydrate peptide conjugate stimulates the antibody and T-cell response without stimulating undesired immune responses. The composition CC is capable of increasing the survival of tumour bearing humans and CC animals. The present sequence corresponds to residues 830-844 of tetanus CC coxin. The synthetic peptide corresponds to this sequence may be used to as an epitope in a carbohydrate peptide conjugate.
                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAW71321-22 represent universal helper T-cell epitopes derived from tetanus toxin. They are used to enhance host immune response to vaccines. The specification describes a plasmodium yoelii liver stage 17 kDa hepatic and erythrocytic stage protein designated PyHEP17. This protein elicits a response from an 1g1 monoclonal antibody designated Navy Yoelii Liver Stage 3 (NYLS3). This antibody does not recognise sporozoites, but does recognise P. yoelii liver stage parasites. NYLS3 eliminates upto 90% of liver stage parasites. The specification describes a vaccine for reducing the severity or incidence of infection by a malaria parasite of the genus Plasmodium. The DNA vaccine comprises exon 1 and part of exon 2 of the PyHEP17 gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  electrophilic reaction centre, preferably a phosphonate or boronate moiety. Depending on the identity of the epitope, the CRAA may be used to stimulate production of catalytic antibodies specific for predetermined antigens associated with particular medical disorders. They may also be used to permanently inactivate endogenously produced transpared to antibodies produced in certain autoimmune diseases as well as in certain lymphoproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of formula X1-Y-E-X2, in which at the profession, Y is a positively of an epitope of a disease-associated protein, Y is a positively charged amino acid residue, preferably Lys or Arg, and E is an charged amino acid residue, preferably a phosphonate or boron.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Amongst the specifically exemplified CRAAs is one based on residues 421-436 of a B-cell epitope of gpl20 (see AAR94046) which may be used to counter HIV-1 infections. When used as an immunogen, preferably this CRAA is conjugated at its N-terminal to a T-helper epitope from tetanus toxoid. The present sequence represents the T-helper epitope and corresponds to residues 830-844 of the toxoid.
                                                                                                               01-DEC-1998
                                                                                                                                                                                                                            Chimeric;
                                                                                                                                                                                                                                                         T-cell epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

This sequence represents a tetanus toxoid epitope and is recognised by the multispecific single chain antibody designated H22. The antibody can be used in the method of the invention for inducing antibody-dependent cellular cytotoxicity (ADCC) against a tumour cell which is characterised by overexpression of HER 2/neu or epidermal growth factor receptor (EGFR), comprises contacting the tumour cell with a multispecific protein molecule (preferably a single chain antibody) comprising: (a) an anti-Fc receptor antibody or an antigen binding fragment; (b) a portion which binds to HER 2/neu; and (c) a portion which
                                                                                                                                                                         comprising an a target cell
                                                                                                                                                                                                                                                            Deo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Multispecific single chain antibody; antibody H22; tumour cell; therapy; antibody-dependent cellular cytotoxicity; ADCC; HER 2/neu; infection; epidermal growth factor receptor; breast cancer; ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce in immune response against non-typable Haemophilus influenzae. This sequence represents an example of a T-cell epitope peptide used to generate the chimeric peptide.
                                                                                                                                                                                                  Specific killing of tumour cells - using a multi-specific molecule

                                                                                                                             The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                   Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic

The method can be used for treating cancers especially breast cancer or ovarian cancer. The multispecific antibody can also be administered prophylactically to vaccinate a subject against infection by a target cell.

The compound comprises at least one allergen CC antigenic determinant (i) recognised by a B cell or an antibody secreted CC by a B cell of a non-atopic individual and at least one antigenic CC determinant (ii) different from the allergen that triggers T cell CC activation. (I) has antiallergic, antiasthmatic. antinflammatory. CC dermatological and immunosuppressive activities, and can be used in a CC vaccine. (I) may be used in a pharmaceutical or cosmetic medicament to CC treat and/or prevent allergies or a disease of allergic origin, CC especially hypersensitivities. These include rhinitis, sinustis, CC urricaria, gastro-intestinal syndromes associated with the ingestion of CC conditions active during the propersensitivities and/or a mixture of these. The CC associated with the treatment of allergic conditions avoids the need for CC drug treatment, which often causes undesirable side-effects. Also, prior are thrug therefore a summer of allergic conditions are their their causes undesirable side-effects. Also, prior

The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (i) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the east 1 clast 1 B-cell group which is foreign to the animal. Analogues of human PSM, human Her2 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Foreign epitope; P2; prostate specific membrane antigen; PSM; Her2; Heregulin 2; Fibroblast growth factors, FGF8b; vaccination; cytotoxic T-lymphocyte immunity; self-protein; cancer; breast cance prostate cancer; cell-associated peptide antigen.

                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents the tetanus toxoid P2 epitope. It is CC used to create a fusion protein with murine osteoprotegerin ligand CC (OPGL). Osteoprotegerin is a secreted member of the tumour necrosis CC factor receptor family, which blocks osteoclastogenesis in a dose consense the protein. The opgl protein is synthesised as a type II CC transmembrane protein. The murine and human OPGL polypeptides are 87% CC transmembrane protein. The murine and human OPGL polypeptides are 87% CC combined with CSF-1. It is not capable of inducing osteoclast CC combined with CSF-1. It is not capable of inducing osteoclast of CC differentiation in the absence of CSF-1. OPGL is also an activator of CC down-regulation of OPGL activity in an animal. The method comprises CC using at least one OPGL polypeptide or subsequence, and/or at least one OPGL polypeptide or subsequence, and/or at least one OPGL polypeptide or subsequence, and/or at least one CC and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  conditions so that cleavage occurs at aspartate prolline dispeptide site without solubilising the protein. The cleavage is accomplished while the fusion protein is in an insoluble aggregate form which facilitates for purification of the protein. The method is useful for producing pure purification of the protein. The method is useful for producing pure for proteins including recombinant human and animal therapeutic antibiotic and vaccine peptides, enzymes, protein polymers, and antibacterial for enzymes for foodstuffs.

The present sequence is a T-cell activating epitope P2 derived from tetamus toxoid protein. This sequence was fused to a DNA encoding from tetamus toxoid protein. This sequence was fused to a DNA encoding for finectious pancreatic necrosis virus surface glycoprotein which is a vaccine candidate. This chimeric protein was in turn fused to DNA encoding C. crescentus S-layer protein from amino acid 690 onwards and contains native Asp-Pro site) for construction of a recombinant fusion construct which is expressed in Caulobacter and then cleaved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                AAE11763;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The patent discloses a method for cleaving a recombinant fusion protein which is produced by Caulobacter and consists of Caulobacter surface layer (S-layer) protein (containing the C-terminal secretion signal) and a target protein heterologous to Caulobacter. The cleavage of target protein from the S-layer protein is carried out under mild acid

                                                                                                                      Ş
                                                                                                                                                                                                                                                                                           The invention relates to a method for in vivo down-regulation of amyloid CC protein such as beta amyloid (Abeta) in an animal, including human. The CC method comprising presenting to the animal's immune system an CC immunogenically effective amount of at least one amyloidogenic protein CC or its subsequence and/or at least one analogue of the amyloidogenic CC polypeptide. The amyloidogenic protein or its subsequence, and its CC analogue is useful for the preparation of an immunogenic composition CC comprising an adjuvant for down-regulating amyloid in an animal. They are CC also useful in the treatment, prophylaxis or amelioration of Alzheimer's CC disease or other diseases characterised by amyloid deposits. They are CC also useful in the treatment of systemic amyloidosis, maturity onset CC disease or other diseases, Huntington's disease, fronto-temporal CC dementia, amyotrophic lateral sclerosis (ALS), Pick's disease and CC prion-related transmissable spongiform encephalopathies. They are also CC useful for inducing production of antibodies against an amyloidogenic CC polypeptide. The present sequence is Clostridium tetani P2 epitope CC related to the invention.
                                                                                                                                                                     Query Match

                                                                                                                                        FUNCTION: ESSENTIAL COMPONENT OF A NEUREGULIN-RECEPTOR COMPLEX, ALTHOUGHT NEUREGULINS DO NOT INTERACT WITH IT ALONE. GP30 IS A POTENTIAL LIGAND FOR THIS RECEPTOR. NOT ACTIVATED BY EGF, TGF-ALPHA AND AMPHIREGULIN (BY SIMILARITY).

CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.

SUBUNIT: HETERODIMER WITH EACH OF THE OTHER ERBB RECEPTORS (POTENTIAL).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MISCELLANEOUS: Binding of EGF to the receptor leads to dimerization, internalization of the EGF-receptor complinduction of the tyrosine kinase activity, stimulation synthesis, and cell proliferation.

SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: Receptor for EGF, but also for other members of the EGF family, as TGF-alpha, amphiregulin, betacellulin, heparin-binding EGF-like growth factor, GP30 and vaccinia virus growth factor. Is involved in the control of cell growth and differentiation.
FUNCTION: Isoform 2/truncated isoform may act as an antagonist. CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tyrosine phosphate.
SUBCELLULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expressed in ovarian cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              alternative splicing.

SUBCELLULAR LOCATION: Type I membrane protein.
MISCELLANEOUS: Binding of EGF to the receptor leads to
dimerization, internalization of the EGF-receptor complex,
induction of the tyrosine kinase activity, stimulation of
synthesis, and cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     synthesis, and cell proliferation.
SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.

RECEPTORS (POTENTIAL).

SUBCELLULAR LOCATION: Type I membrane protein.

ALTERNATIVE PRODUCTS: 2 ISOFORMS; JM-A (SHOWN HERE) AND JM-B; ARE PRODUCED BY ALTERNATIVE SPLICING. THE TWO ISOFORMS DIFFER FUNCTIONALLY IN THEIR RESPONSE TO PHORBOL ESTER: JM-A IS PROCESSED BUT NOT JM-B. SO, THEY RESPECTIVELY REFRESENT CLEAVABLE AND NONCLEAVABLE FORMS OF THE RECEPTOR. BOTH ISOFORMS ARE EXPRESSED IN CEREBELLUM, BUT ONLY THE JM-B ISOFORM IS EXPRESSED IN THE HEART.

CEREBELLUM, BUT ONLY THE JM-B ISOFORM IS EXPRESSED IN THE HEART.

TISSUE SPECIFICITY: EXPRESSED AT HIGHEST LEVELS IN BRAIN, HEART, KIDNEY, IN ADDITION TO SKELETAL MUSCLE, PARATHYROID, CEREBELLUM, PITUITARY, SPLEEN, TESTIS AND BREAST. LOWER LEVELS IN THYMUS, LUNG, SALIVARY GLAND, AND BRANST. LOWER LEVELS IN THYMUS, LUNG, SALIVARY GLAND, AND PANCREAS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               EMBL; L07868; AAB59446.1; -. SUBCELLULAR LOCATION: Type I membrane protein.
DISEASE: INVOLVED IN PIGMENT CELLS MALIGNANT MELANOMAS.
SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mitted (JUL-2000) to the EMBL/GenBank/DDBJ databases.
FUNCTION: PROBABLE RECEPTOR WITH PROTEIN-TYROSINE KINASE ACTIVITY
CAPALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     s requires a license agreement (S. an email to license@isb-sib.ch).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               515.
